

Roofing and Sheet Metal RD Herbert & Sons

Portfolio :: Architectural Sheet Metal

Metal Specialties – Nashville, TN

PROJECT INFORMATION:

Metal Specialties are the finishing touches to a roof; details that highlight the building edges, channel rain water and seal a structure while adding character, color and charm to the facade. A wide variety of materials, colors and styles are available for the range of metal specialties. Copper, Stainless Steel, Kynar Steel and Aluminum, and Zinc are just a few of the materials we offer with outstanding results.

CONDUCTOR HEADS:

From timelessly elegant to classic lines, the multitude of styles for conductor heads is endless. These functional pieces add decoration and character to a building.

SPIRES & FINEALS

These finishing touches can be ornate or quite simple.

CHIMNEY CAPS:

Traditionally fabricated from copper, chimney caps serve a functional purpose to keep rain water and animals from entering a home.

GUTTERS & DOWNSPOUTS:

Rain water collection systems divert water from the roof to the ground while adding an aesthetic touch to a building's edges. Style options include: built-in, half-round, ogee, or box gutters with either rectangular, round or square downspouts.

COPINGS:

Copings protect the top of parapet walls from the elements. A wide variety of color and material choices allow the owner to customize the building. Typical seam options include: lap, cover plate, concealed plate, or standing seam.

EDGE METAL:

Edge metal defines and finishes the perimeter of the building.

FLASHINGS;

Metal flashings are important at critical junctures of angle or material changes. Typical roof flashings include wall, valley, curb, penetration, step flashings, and counterflashings.
